Transferring Prince Pan to Team 1 Delhi

Date: Aug 6, 2017, 11:08 PM

As discussed, single button download should contain outlet name as folder and image name to be in pre & post but currently it only has a zip file and doesnt contain the above details in it.

In job analysis report the traveling time is in 4minutes 38seconds which we need in decimal 4.38.

Please look forward to the problems

Based on the pilot done in Pune would like to share the following feedback and suggested way forward.

RA Housekeeping mobile app feedback

1. The color of RA should feature in the report in portal whenever any filters are applied.
2. In the mobile, an option is to be provided to view the non-synced outlets with details like – date, zone, outlet name, color of RA & team.
3. There are three different reports for job overview in the portal all of which were showing same data, it is recommended to have only one type of such report in the portal.
4. Whenever the cleaning team is selecting one of the job cancellation reason (bad weather/outlet closed or Owner rejected). The option to take photo only for “PRE SITE” & "POST SITE" should be active, rest all scope of work including repairs should be inactive.
5. In the mobile app “PRE SITE” image to be active in the beginning and the “POST SITE” image is only to be active after taking retailer signature.
6. Currently the cleaner can access the cleaning work scopes available without selecting the outlet. We need to make selection of outlet as mandatory.
7. Create a new icon with label for creating “New outlet “in that zone.

As per the discussion between Mayabious and ITC (Sambhav, Chayan & Bastab) today. Following are the briefs.

Mobile App

- 1) While starting the app, it should prompt the user to turn on location service by going to settings without which the app will not let the user to proceed any further.
- 2) At least one worker should be added as a team member before a user can start a day. There will be provision for viewing / editing the workers so added in the team for a certain day in the app.
- 3) Save, Reset/Clear and Back buttons in the Owner Signature needs to be in the bottom of the screen in order to maintain similar design pattern all over the app.
- 4) Remark field for Repair section should open up a separate Modal with ample space to type out remarks / comments.
- 5) In the Repair section, provision for taking multiple images needs to be incorporated. The images thus taken should be displayed in a Grid or any convenient form.
- 6) A certain Team and the associated Workers will be identified with the mobile phone's IMEI Number.
- 7) A user can view his current location along with all the stores (which he needs to clean that day) location in the map.
- 8) A database synchronization methodology needs to be implemented where the app will be able to handle Online and Offline network state and upload data to the server showing an upload status bar. All data needs to be cleaned from app local storage after verifying successful sync operation.
- 9) A new feature has been proposed by the client. While installing the app, it needs to receive some

Plz send this to Sambhav and Chayan:

Dear All,

After a series of discussions with my team we have created a structural diagram based on our understanding of the entire procedure. Kindly find the same attached.

Also we have a few queries as some of the terminologies used within the headers of the outlet report excel files, they are:

WD (example: DA, MD, SLV etc)

Administrator (example: Dilip, Karan etc.)

Color (example: Navibblue, Maroon)

Type (example: RA, RA & Onshop)

As per our current understanding of the scope of work, it will take us 30 working days to complete the project. On your approval/ comment on the above, we shall go ahead and send a break of of the entire procedure along with the phase by phase deliverables.
